

PATENT  
P56988IN THE CLAIMS

Pursuant to 37 CFR §121(c), the claim listing, including the text of the claims, will serve to replace all prior versions of the claims, in the application.

Please cancel claims 1 through 20 without prejudice or disclaimer, add claims 24 through 43:

1           1 through 20. (Cancelled)

1           21. (Previously Presented) A device for collecting and processing folded printed  
2           products, comprising

3           a collection drum rotatably drivable about its drum axis and comprised of first rests  
4           with first saddles, said first rests being uniformly distributed over the circumference and  
5           extending in their longitudinal extension parallel to the drum axis, as well as conveyor  
6           elements for conveying the printed products on the first saddles in the axial direction along  
7           the firsts rests, and

8           a conveyor device comprising a revolving conveyor having an upper side and a lower  
9           side, a conveyor path with a conveyor direction which at least in a transfer region deviates  
10          from the axial direction, second rests movable in the conveyor path, and second saddles  
11          arranged distanced to one another and arranged transversely to the conveying direction, with  
12          the conveyor device in the transfer region arranged adjacent to an end of the collection drum  
13          to enable carriage of the printed products to be transferred from an end to the conveyor  
14          device or vice versa, and the second rests being movable propelled along the conveyor path  
15          independently from the collection drum.

1           22. (Previously Presented) The device of claim 21, further comprising at least one  
2           station positioned radially on an inside of the revolving conveyor, disposed to modify printed  
3           products carried by the revolving conveyor.

PATENT  
P56988

1        23. (Previously Presented) The device of claim 21, further comprising a securement  
2 system disposed along the lower side hindering printed products from escaping from carriage  
3 with the second rests.

1        24. (New) A device for collecting and processing folded printed products, comprising  
2              a collection drum comprising a terminal end and a plurality of first rests  
3 bearing first saddles, said first rests being uniformly distributed over a circumference of the  
4 collection drum and extending in a longitudinal direction away from the terminal end and  
5 parallel to an axis of the collection drum to convey the printed products borne by the first  
6 saddles in an axial direction along the firsts rests, the collection drum being rotatably  
7 drivable about the axis of the collection drum; and

8              a conveyor device being detachable from the collection drum and rotatably  
9 drivable independently of the conveyor drum, and when positioned in operationally  
10 cooperative proximity to the terminal end of the collection drum, enabling the end of the  
11 collection drum to define a transfer region of the conveyor device, the conveyor device  
12 comprising second rests movable along the conveyor path bearing second saddles arranged  
13 spaced-apart from one another and arranged transversely to the conveying direction to define  
14 a conveyor path with a conveyor direction able to deviate in the transfer region from the axial  
15 direction, the conveyor device accommodating within the transfer region a transfer of the  
16 printed products between the first rests at the collection drum terminal end and the second  
17 rests of the conveyor device.

1        25. (New) A device according to claim 24, comprising the conveyor device  
2 accommodating operating conditions with selected ones of wire saddle stitching stations,  
3 adhesing stations, and an additional collection station disposed to directly modify the printed  
4 products while the printed products are carried by the conveyor device on an upper side of

PATENT  
P56988

5       the conveyor device.

1           26. (New) A device according to claim 25, comprising bending elements integrated  
2       with the second rests, and at least one stapling apparatus operationally aligned with the  
3       conveyor assembly as a working station operationally engaging the bending elements.

1           27. (New) A device according to claim 26, comprising the stapling apparatus being  
2       movably mounted on a rail guided approximately parallel to the conveyor path.

1           28. (New) A device according to claim 24, comprised of the second rests being  
2       movably supported on rails.

1           29. (New) A device according to claim 28, comprised of the second rests traversing  
2       a side opposite the second saddles being supported on at least one rail.

1           30. (New) A device according to claim 25, wherein the second rests are movably  
2       supported on rails.

1           31. (New) A device according to claim 30, comprised of the second rests traversing  
2       sides opposite the second saddles being supported on at least one rail.

1           32. (New) A device according to claim 24, comprised of the conveyor device  
2       selectively accommodating operating connections with selected ones of inserting stations,  
3       binding stations, wire saddle stitching stations, adhesing stations, and an additional  
4       collection station disposed to directly modify the printed products while the printed products  
5       are carried by the conveyor device.

PATENT  
P56988

1       33. (New) A device according to claim 24, comprised of the second saddles for the  
2 second rests along the complete conveyor path are movable in parallel and spaced-apart by  
3 a predefined, equal distance from one another, and conveyor device being disposed to  
4 cooperate with the second rests closest to the saddle.

1       34. (New) A device according to claim 24, comprised of a plurality of working  
2 stations allocated to the conveyor device in an exchangeable sequence.

1       35. (New) A device according to claim 24, comprising bending fixtures integrated  
2 with the second rests, and at least one stapling apparatus operationally aligned with the  
3 conveyor device as a working station movably mounted on a rail guided parallel to the  
4 conveyor path.

1       36. (New) A device according to claim 24, wherein the conveyor device comprises  
2 a revolving conveyor with an upper and a lower side with an essentially horizontal conveyor  
3 path.

1       37. (New) A device for collecting and processing folded printed products,  
2 comprising:

3              a collection drum rotatably drivable about a drum axis, the collection drum  
4 comprising first rests bearing first saddles, said first rests being uniformly distributed over  
5 a circumference of the collection drum and extending away from a terminal end of the  
6 collection drum in a longitudinal direction parallel to the drum axis to convey any printed  
7 products on the first saddles in the longitudinal direction along the firsts rests; and

8              a conveyor assembly comprising a conveyor path exhibiting a conveyor  
9 direction able to deviate in the transfer region from the axial direction, second rests arranged  
10 spaced-apart from one another and disposed transversely to the conveying direction, and a

PATENT  
P56988

11 carriage unit detached from the collection drum and disposed to propel the second rests along  
12 the conveyor path, said conveyor assembly being operatively cooperative with the collection  
13 drum while detached from the collection drum and forming a transfer region when  
14 operatively arranged adjacent to a terminal end of the collection drum to accommodate  
15 transfer of the printed products between the first saddles at the terminal end of the collection  
16 drum and the conveyor assembly.

1       38. (New) A device according to claim 37, comprised of the second rests bearing  
2 bending fixtures, and at least one stapling apparatus movably mounted on a rail guided  
3 parallel to the conveyor path in operational alignment with the bending fixtures.

1       39. (New) A device according to claim 37, comprised of the conveyor assembly  
2 selectively accommodating operating connections with selected ones of inserting stations,  
3 binding stations, wire saddle stitching stations, adhesing stations, and an additional  
4 collection station disposed to directly modify the printed products while the printed products  
5 are carried by the conveyor device, with the stations being allocated to the conveyor device  
6 in an exchangeable sequence.

1       40. (New) A device for collecting and processing folded printed products,  
2 comprising:

3              a collection drum rotatably driveable about a drum axis, said collection drum  
4 comprising a terminal end bearing first rests with first saddles, said first rests being  
5 uniformly distributed over a circumference and extending in longitudinal directions away  
6 from the terminal end parallel to the drum axis to convey the printed products on the first  
7 saddles in the longitudinal directions along the first rests; and

8              a conveyor assembly positionable independently of the collection drum, said  
9 conveyor assembly comprising a plurality of second saddles distanced apart from one another

PATENT  
P56988

10 and arranged transversely to the conveying direction, and a conveyor unit rotatably drivable  
11 independently of the collection drum to propel the second saddles along a conveyor path with  
12 orientation of the second saddles being disposed to deviate in a transfer region from the axial  
13 direction, said conveyor path being selectively alignable the drum axis in proximity to the  
14 terminal end of the collection drum to form a transfer region to accommodate transfer of the  
15 printed products between the first saddles at the terminal end and the second saddles.

1       41. (New) A device according to claim 40, comprising bending elements integrated  
2 with the second rests, and at least one stapling apparatus operationally aligned with the  
3 conveyor assembly as a working station operationally engaging the bending elements, the  
4 stapling apparatus being movably mounted on a rail guided approximately parallel to the  
5 conveyor path.

1       42. (New) A device for collecting and processing folded printed products,  
2 comprising:

3           a collection drum rotatably driveable about a hub exhibiting a drum axis, the  
4 collection drum providing a terminal portion forming a transfer region, said terminal portion  
5 comprising first rests bearing first saddles, said first rests being uniformly distributed over  
6 a circumference and extending in longitudinal extension parallel to the drum axis, and  
7 conveyor elements arrayed to convey the printed products on the first saddles in an axial  
8 directions along the firsts saddles; and

9           a conveyor assembly comprising a plurality of spaced-apart second saddles and  
10 a conveyor unit rotatably drivable independently of the collection drum and disposed to  
11 propel the second saddles along the conveyor path to accommodate within said transfer  
12 region of the collection drum, transfer of printed products between the first rests and the  
13 plurality of second rests as the second rests are propelled by the conveyor assembly along the  
14 conveyor path, the second saddles being disposed to deviate in the transfer region from an

PATENT  
P56988

15 axial alignment with the second axis while providing alignment between the first saddles and  
16 the second saddles within the transfer region.

1       43. (New) A device according to claim 42, comprised of bending elements integrated  
2 with the second saddles, and at least one stapling apparatus operationally aligned with the  
3 conveyor assembly as a working station operationally engaging the bending elements, the  
4 stapling apparatus being movably mounted on a rail guided approximately parallel to the  
5 conveyor path.
